Problems and Issues:

- One of the major problem we counter was with environment setup, where the dotenv was not reading the database_url, so then we had to explicitly enter the database url or local testing. Another problem we encounter was with the database migration where we forgot to add the postinstall script, which was a easy fix.

- Another main issue was about schedule conflict, it roughly took about couple weeks to settle down and agree for strict meeting time that everybody on this team would be available to show up.

- In order to develop efficiently as a team, we're going branch out development branch from master branch, in which we will branch certain functionalities in separate sub-branches. Once we are done with certain functionality, let's say login feature, we will push into development branch to resolve issues and bugs. We will also do code reviews upon pull request, having eyes on each other's shoulders. We have chosen Slack as a basic communication tool and we have one virtual meeting through Google Hangouts and one physical meeting in the library on the day of class.
